Feel free to work with other students, but make sure you write up the homework and code on your own (no copying homework *or* code; no pair programming). Feel free to ask students or instructors for help debugging code or whatever else, though. The starter code for problem 2 part c and d can be found under the Resource tab on course website.

*Note:* You need to create a Github account for submission of the coding part of the homework. Please create a repository on Github to hold all your code and include your Github account username as part of the answer to problem 2.

**1** (**Linear Transformation**) Let  $\mathbf{y} = A\mathbf{x} + \mathbf{b}$  be a random vector. show that expectation is linear:

$$\mathbb{E}[\mathbf{y}] = \mathbb{E}[A\mathbf{x} + \mathbf{b}] = A\mathbb{E}[\mathbf{x}] + \mathbf{b}.$$

Also show that

$$\operatorname{cov}[\mathbf{y}] = \operatorname{cov}[A\mathbf{x} + \mathbf{b}] = A\operatorname{cov}[\mathbf{x}]A^{\top} = A\mathbf{\Sigma}A^{\top}.$$

First, 
$$E[y] = E[A \times +b]$$

$$= \int_{S} P(x) (A \times +b) dx$$

$$= A \int_{S} P(x) \times dx + b \int_{S} P(x) dx$$

$$= A E(x) + b.$$
Also, by definition,  $cov \in X = E[(x - E(x))(x - E(x))^{T}]$ .
Then,  $cov \in [y] = E[(y - E(y))(y - E(y))^{T}]$ 

$$= E[(A \times +b - A E(x) -b)(A \times +b - A E(x) -b)^{T}]$$

$$= E[A(x - A E(x))(A \times - A E(x))^{T}]$$

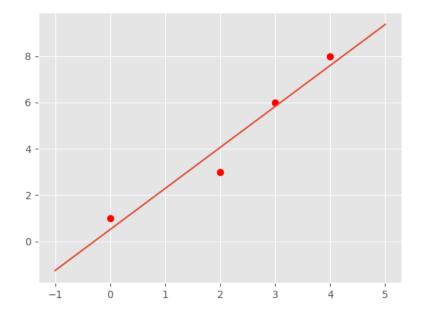

$$= E[A(x - E(x))(x - E(x))^{T}]$$

$$= A E[(x - E(x))(x - E(x))^{T}]$$

$$= A Cov \in X = A^{T}$$

- **2** Given the dataset  $\mathcal{D} = \{(x,y)\} = \{(0,1), (2,3), (3,6), (4,8)\}$ 
  - (a) Find the least squares estimate  $y = \theta^{\top} \mathbf{x}$  by hand using Cramer's Rule.
  - (b) Use the normal equations to find the same solution and verify it is the same as part (a).
  - (c) Plot the data and the optimal linear fit you found.
  - (d) Find randomly generate 100 points near the line with white Gaussian noise and then compute the least squares estimate (using a computer). Verify that this new line is close to the original and plot the new dataset, the old line, and the new line.
- (a) From the problem, we have  $X = \begin{bmatrix} 1 & 0 \\ 1 & 2 \\ 1 & 3 \end{bmatrix}, \quad Y = \begin{bmatrix} 1 \\ 3 \\ 6 \end{bmatrix}. \quad \text{Then, } X^TX = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 2 & 3 \end{bmatrix} = \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix}.$ Next, we have  $X^Ty = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & 2 & 3 & 4 \end{bmatrix} \begin{bmatrix} 1 & 3 \\ 6 & 3 & 4 \end{bmatrix} = \begin{bmatrix} 18 \\ 18 & 6 \end{bmatrix}.$ Then, using Cramer's Rule,  $y = \theta_0 + \theta_1 \times$ , and  $\theta_0 = \frac{118}{156} \frac{9}{14} = \frac{18}{35} \quad \text{and} \quad \theta_1 = \frac{14}{9} \frac{18}{56} = \frac{62}{35}.$ Thus,  $y = \frac{18}{35} + \frac{62}{35} \times .$
- (b) Without using Cramer's Rule,  $\theta = (\chi^{7}\chi)^{-1} \chi^{7} y = \begin{bmatrix} 4 & 9 \\ 9 & 29 \end{bmatrix}^{-1} \begin{bmatrix} 0 & 1 & 1 \\ 0 & 2 & 3 & 4 \end{bmatrix} \begin{bmatrix} \frac{1}{3} \\ \frac{1}{35} \begin{bmatrix} 29 & -9 \\ -9 & 4 \end{bmatrix} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 0 & 2 & 3 & 4 \end{bmatrix} \begin{bmatrix} \frac{1}{3} \\ \frac{1}{35} \end{bmatrix} = \frac{1}{35} \begin{bmatrix} 29 & 11 & 2 & -7 \\ -9 & -1 & 3 & 7 \end{bmatrix} \begin{bmatrix} \frac{1}{3} \\ \frac{1}{35} \end{bmatrix}$   $= \frac{1}{35} \begin{bmatrix} 18 \\ 62 \end{bmatrix} = \begin{bmatrix} \frac{18}{55} \\ \frac{62}{35} \end{bmatrix} \text{ which is the same on the result in (a)}.$
